Three modalities, one reference dataset

198

accepted assets
10 Iberian wildlife species

100 Images / Wikimedia

34 Audio / Xeno-canto

64 Text / Wikipedia + GBIF

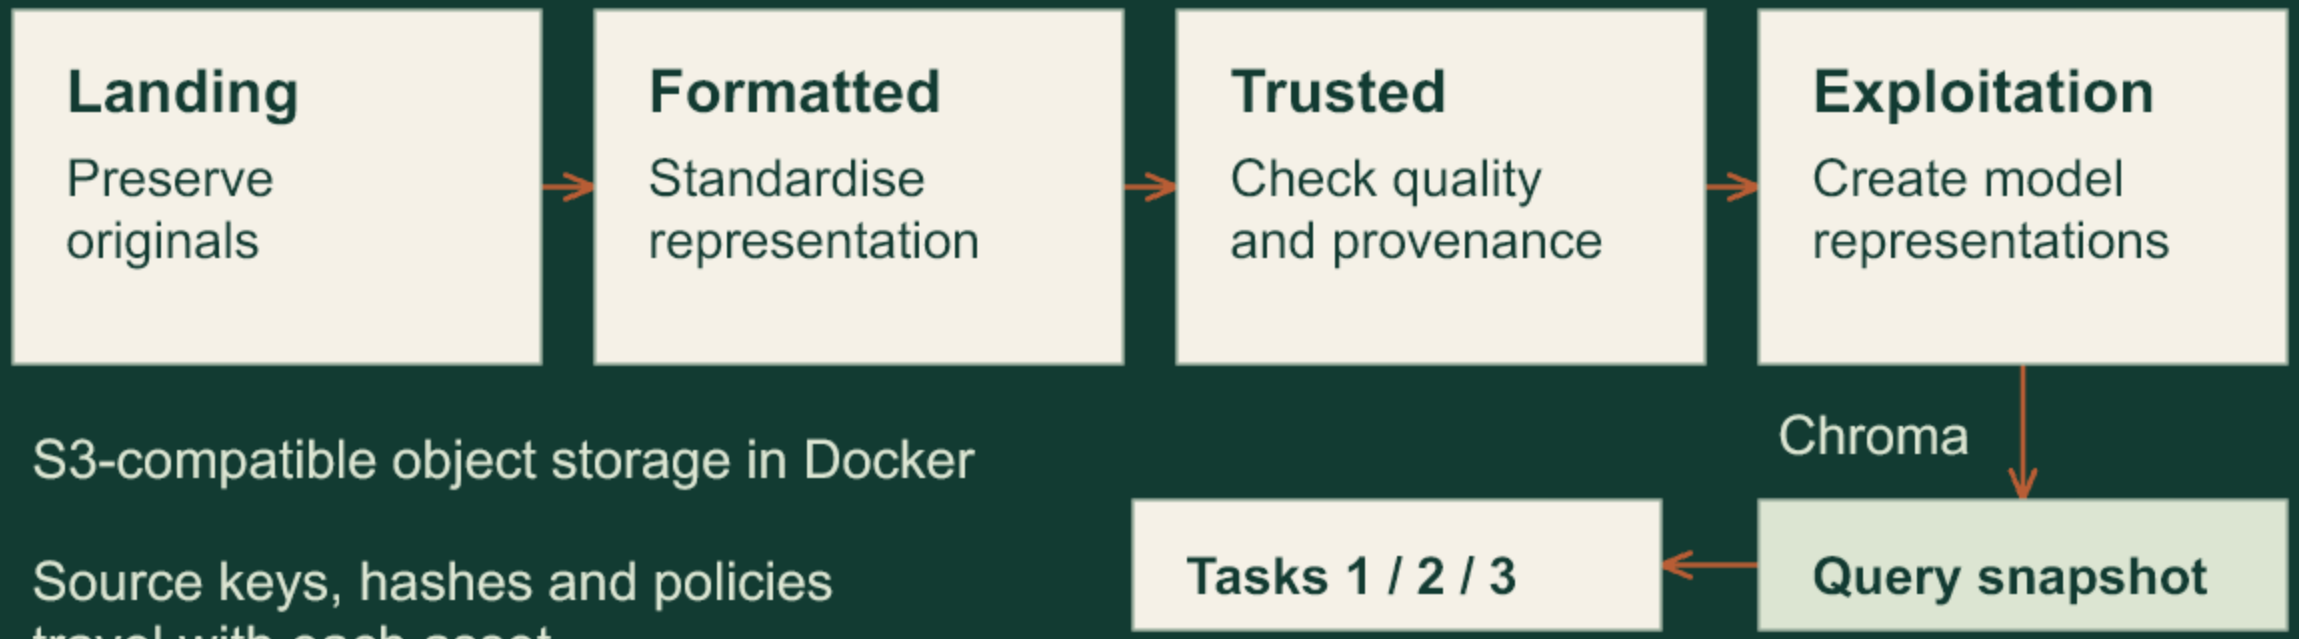

Uneven availability remains visible: no audio for the ocellated lizard

The EcoSentinel pipeline

Optional acquisition or local files / Security Gate

16-step orchestrator

Lock, timeouts and step reports

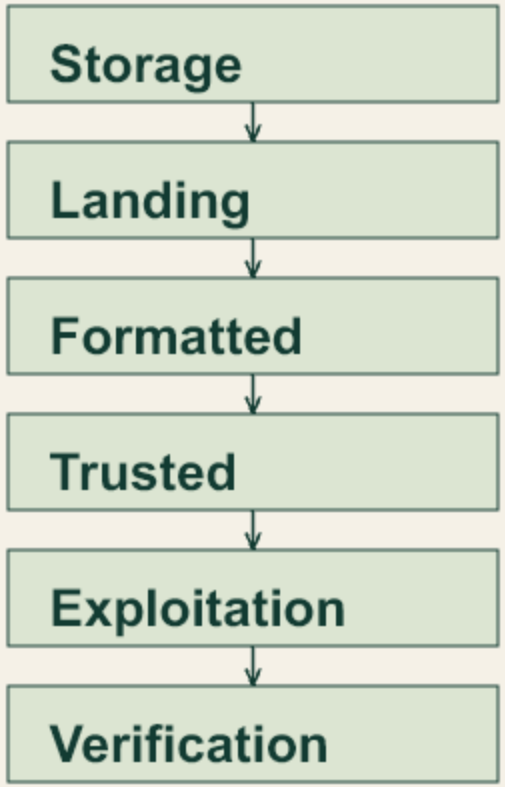

S3-compatible object storage in Docker

Source keys, hashes and policies travel with each asset

The 16 steps in order

Sequential execution. A failure stops the later steps.

1 Check connection 2 Create missing buckets

3 Ingest local files 4 Copy and verify originals

5 Images 6 Audio 7 Text

8 Images 9 Audio 10 Text

11 Images 12 Text 13 Audio
14 Image + text 15 Audio + text

16 Check accepted files against vector parts

Optional downloads after storage add 3 steps: 19 in total.

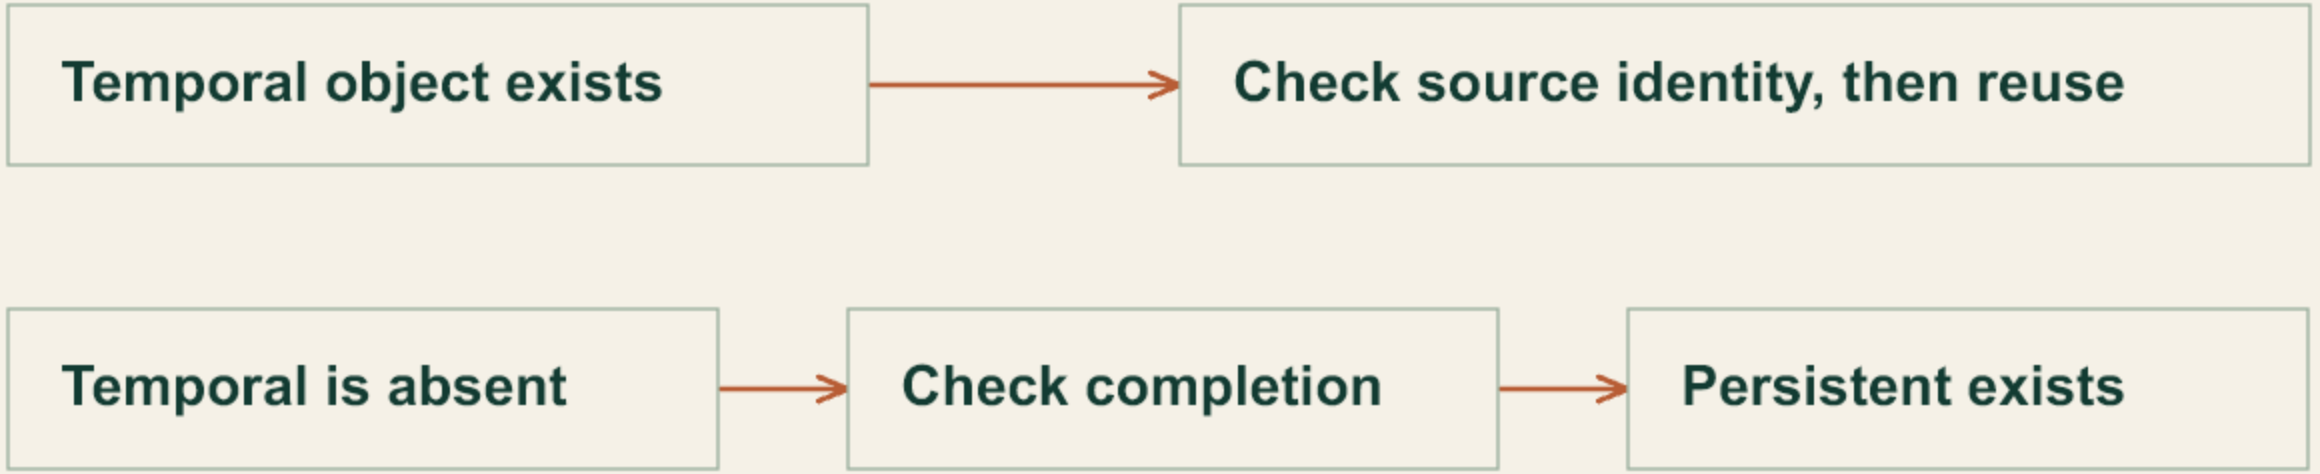

Hashes and embeddings

	SHA-256 hash	Embedding
Question	Did the bytes change?	Which assets are similar?
Output	64 hexadecimal digits	384 or 512 numbers
EcoSentinel use	Identity and integrity	Similarity and retrieval

SHA-256: one byte scan, no decoder or neural model

Landing: file identity and verified copies

temporal_landing/<SHA-256[:16]>__<filename>

Matching identity + recorded Persistent target: skip
No completion record: ingest as new

Verify the copy, then record completion. Missing copies or conflicts fail.

Landing: four identity cases

Same source metadata; the first file is already recorded

Already seen	Incoming file	Key change	Action
 lynx.jpg hash de7879...	 lynx.jpg hash de7879...	None	SKIP
 lynx.jpg hash de7879...	 renamed.jpg hash de7879...	Name	INGEST
 lynx.jpg hash de7879...	 lynx.jpg hash 3e983a...	Hash	INGEST
 lynx.jpg hash de7879...	 renamed.jpg hash 3e983a...	Both	INGEST

New name = new source record. Trusted checks duplicate content.

Formatted choices for wildlife data

Asset	Canonical format	Why it fits this pipeline
Image	RGB JPEG, quality 95	Smaller photo files than typical PNG High quality, original dimensions
Audio	FLAC PCM16	Avoid extra loss in faint animal calls Keep rain, background and quiet intervals
Text	UTF-8, LF, NFC	Preserve multilingual wording JSON: known text keys, then longest string

MPO = several photos in one file. Use the first; keep all originals.

Trade-offs: JPEG loss, PCM16 precision, text layout. No quality gain is assumed.

Trusted: rejection or warning?

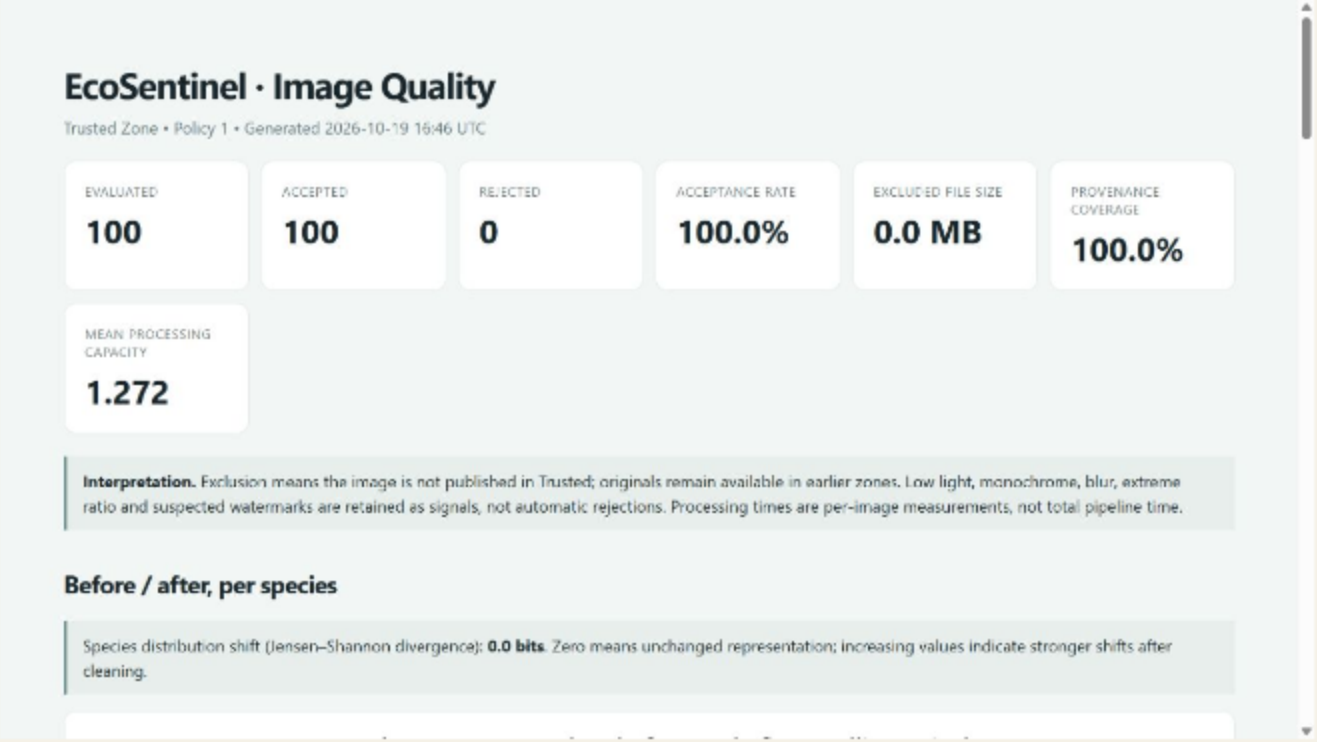

Observation	Policy
Invalid decoding	Reject with a reason
Confirmed image duplicate	Exclude the later matching image
Watermark / low-energy audio	Retain with a warning

Image budget: 20 MB / 40 MP / minimum 128 × 128

Audio: 200 MB / text: 4 MB / preserve previously accepted bytes after later failures

Quality decisions leave an audit trail

Per-asset manifests / HTML + CSV + JSON + plots

EcoSentinel · Image Quality

Trusted Zone • Policy 1 • Generated 2026-10-19 16:46 UTC

EVALUATED	ACCEPTED	REJECTED	ACCEPTANCE RATE	EXCLUDED FILE SIZE	PROVENANCE COVERAGE
100	100	0	100.0%	0.0 MB	100.0%

MEAN PROCESSING CAPACITY
1.272

Interpretation. Exclusion means the image is not published in Trusted; originals remain available in earlier zones. Low light, monochrome, blur, extreme ratio and suspected watermarks are retained as signals, not automatic rejections. Processing times are per-image measurements, not total pipeline time.

Before / after, per species

Species distribution shift (Jensen–Shannon divergence): **0.0 bits**. Zero means unchanged representation; increasing values indicate stronger shifts after cleaning.

100%

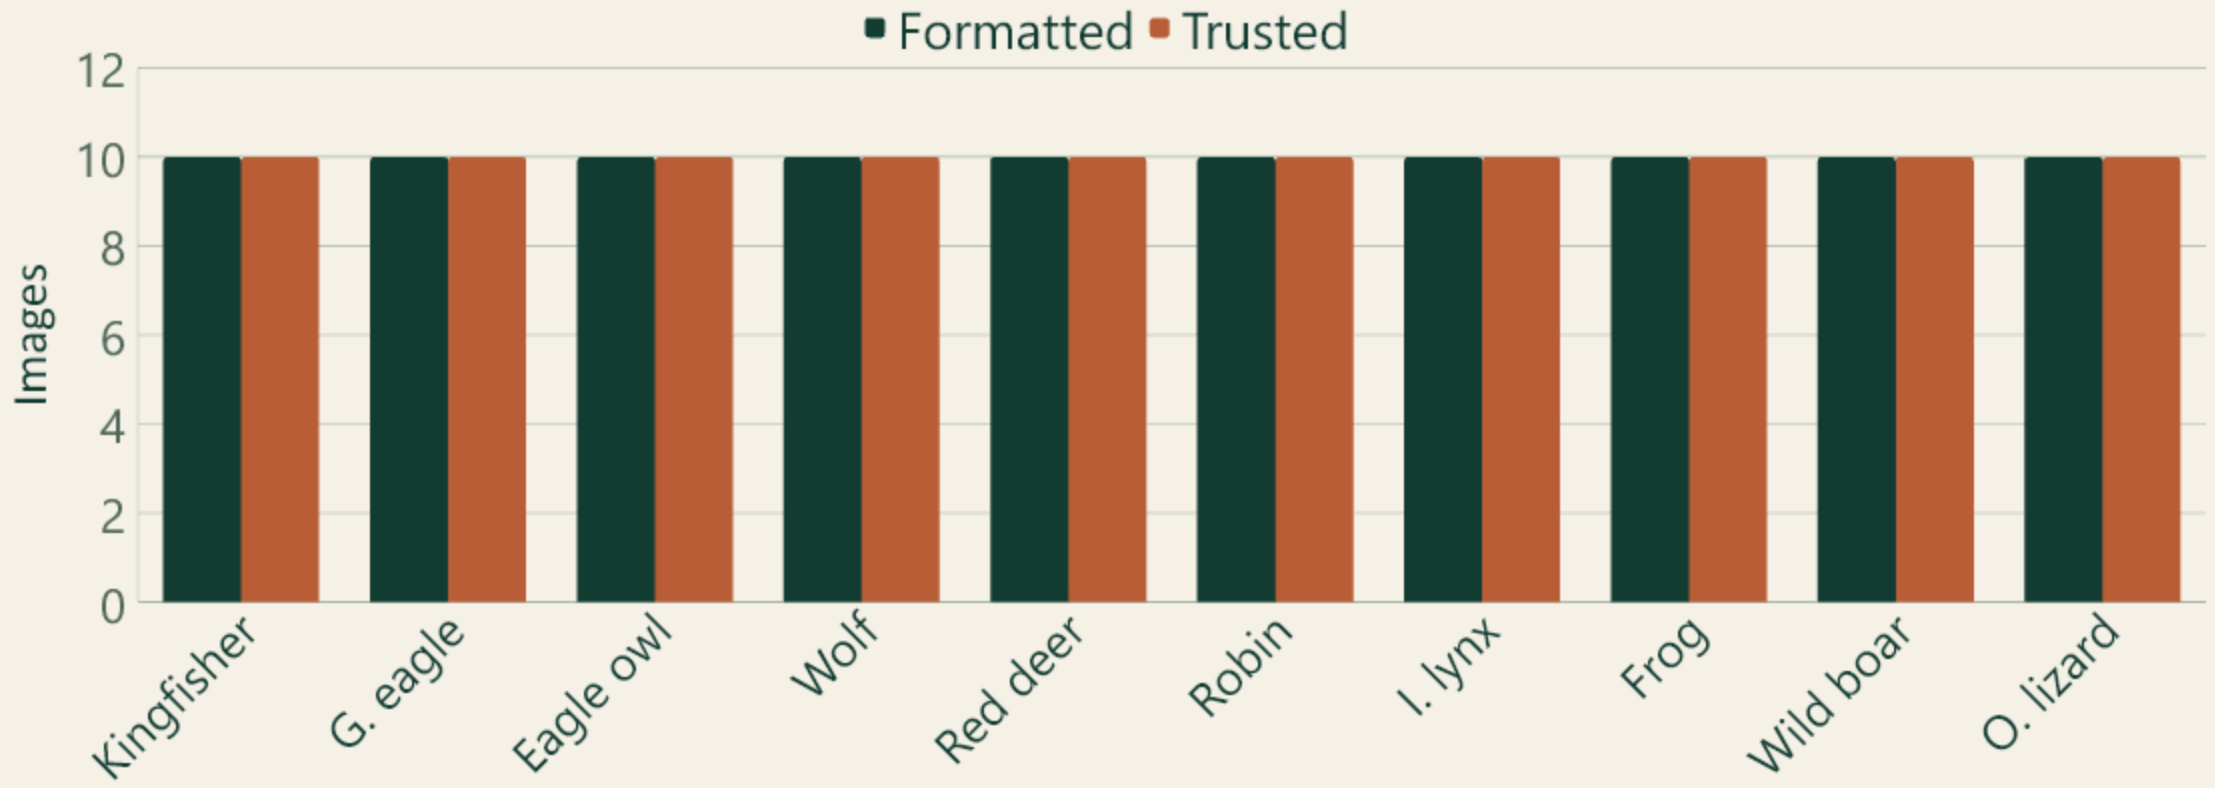

Provenance fields complete

0.0 bits

Species distribution shift

Real image report / 100 retained / 32 possible watermark flags / 19 Oct 2026

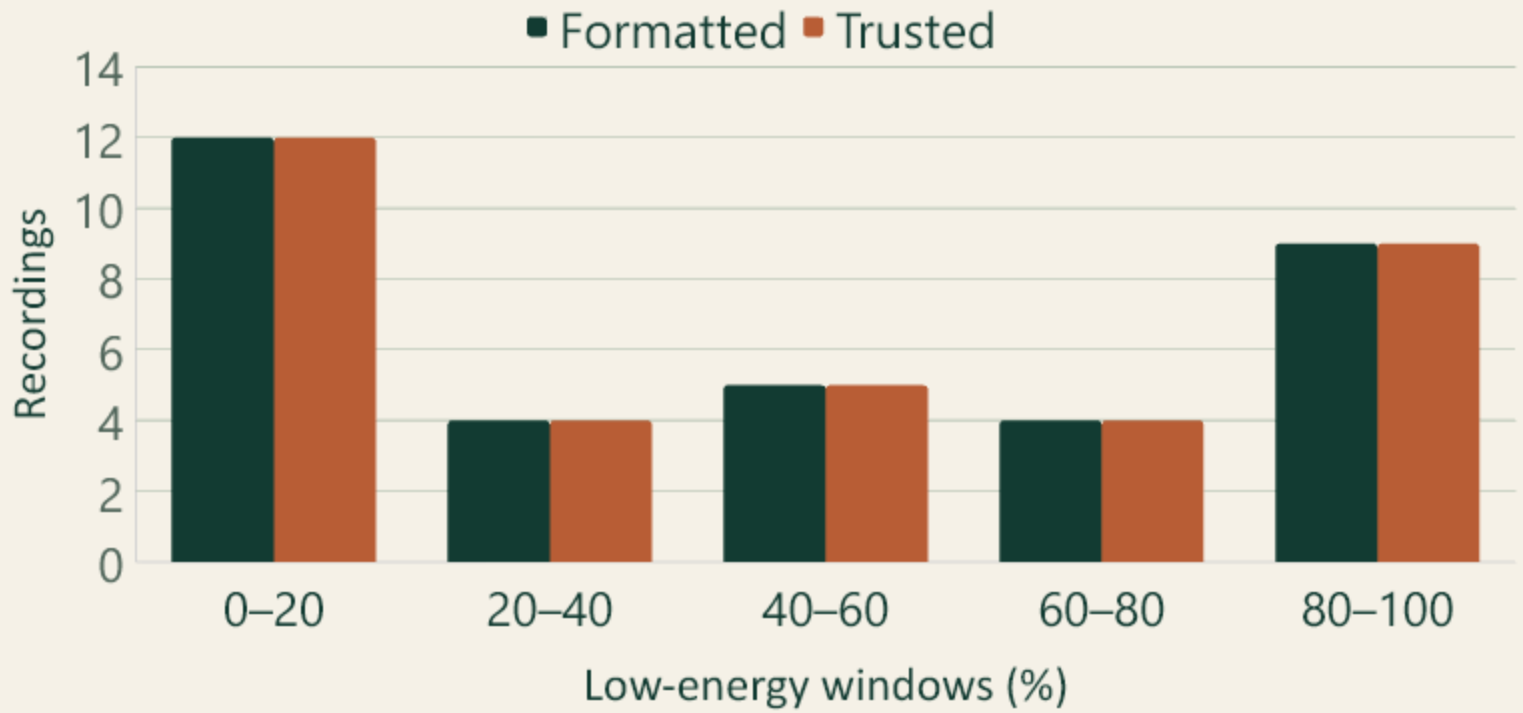

Did filtering change species representation?

100 images before / 100 after / Jensen–Shannon divergence: 0.0 bits

Quiet intervals remain in the evidence

Recordings grouped by low-energy window percentage

9 warnings

34 retained

Complete recordings remain available

50-ms windows below −50 dBFS / flag at ≥80% / same observed distributions

Five collections, 6,021 embeddings

6,021

embeddings
from 198 assets

Image / CLIP	**100**
Audio / CLAP	**357**
Text / E5	**547**
Image + text / CLIP	**1,763**
Audio + text / CLAP	**3,254**

Reuse requires source/model compatibility and exact segment coverage

Three encoders, three relationships

Aligned space: cosine / across models: combine ranks (RRF)

Similarity is an angle, not a probability

$\cos(q, x) = (q \cdot x) / (\|q\| \|x\|)$

Illustrative 2D unit vectors: q = (1, 0) / cosine = dot product

Candidate vector x	Cosine	Relative alignment
(0.96, 0.28)	0.96	Closest of these three
(0.60, 0.80)	0.60	Less aligned
(0.00, 1.00)	0.00	Perpendicular to q

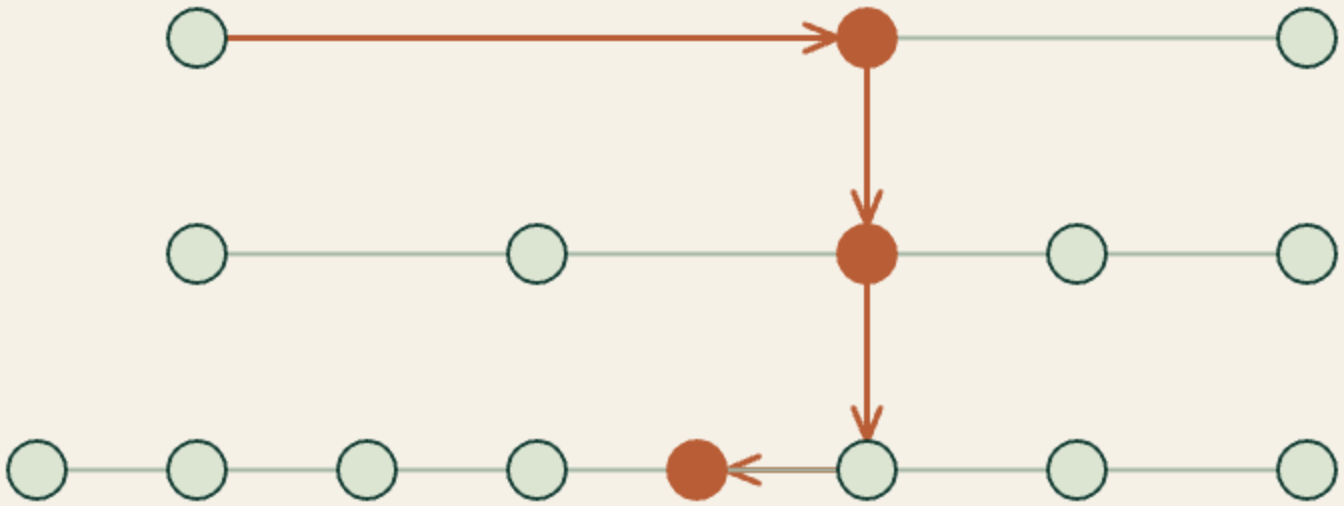

Higher = closer in this space. No universal relevance threshold.

Production: 384 / 512 dimensions. A score of 0.96 is not 96% confidence.

Finding neighbours: HNSW in Chroma

Hierarchical Navigable Small World / approximate nearest neighbours

Sparse

Longer hops

Refine locally

Cosine ranks candidates

Denser

N <= 64 after filters: exact scan / N >= 65: HNSW

64 bounds the fallback work; we have not benchmarked it as an optimum

Task 1: a real image query

REFERENCE IMAGE

Query / CLIP

SELECTED MATCHES / RANKS 1 AND 3

#1 / cosine 0.912

#3 / cosine 0.871

5 distinct assets / reference excluded / 4 lynx labels and 1 wolf label

Task 2: one query, images and text

“Iberian lynx in its natural habitat”

IMAGE #5 / cosine 0.332

TEXT #4 / cosine 0.778

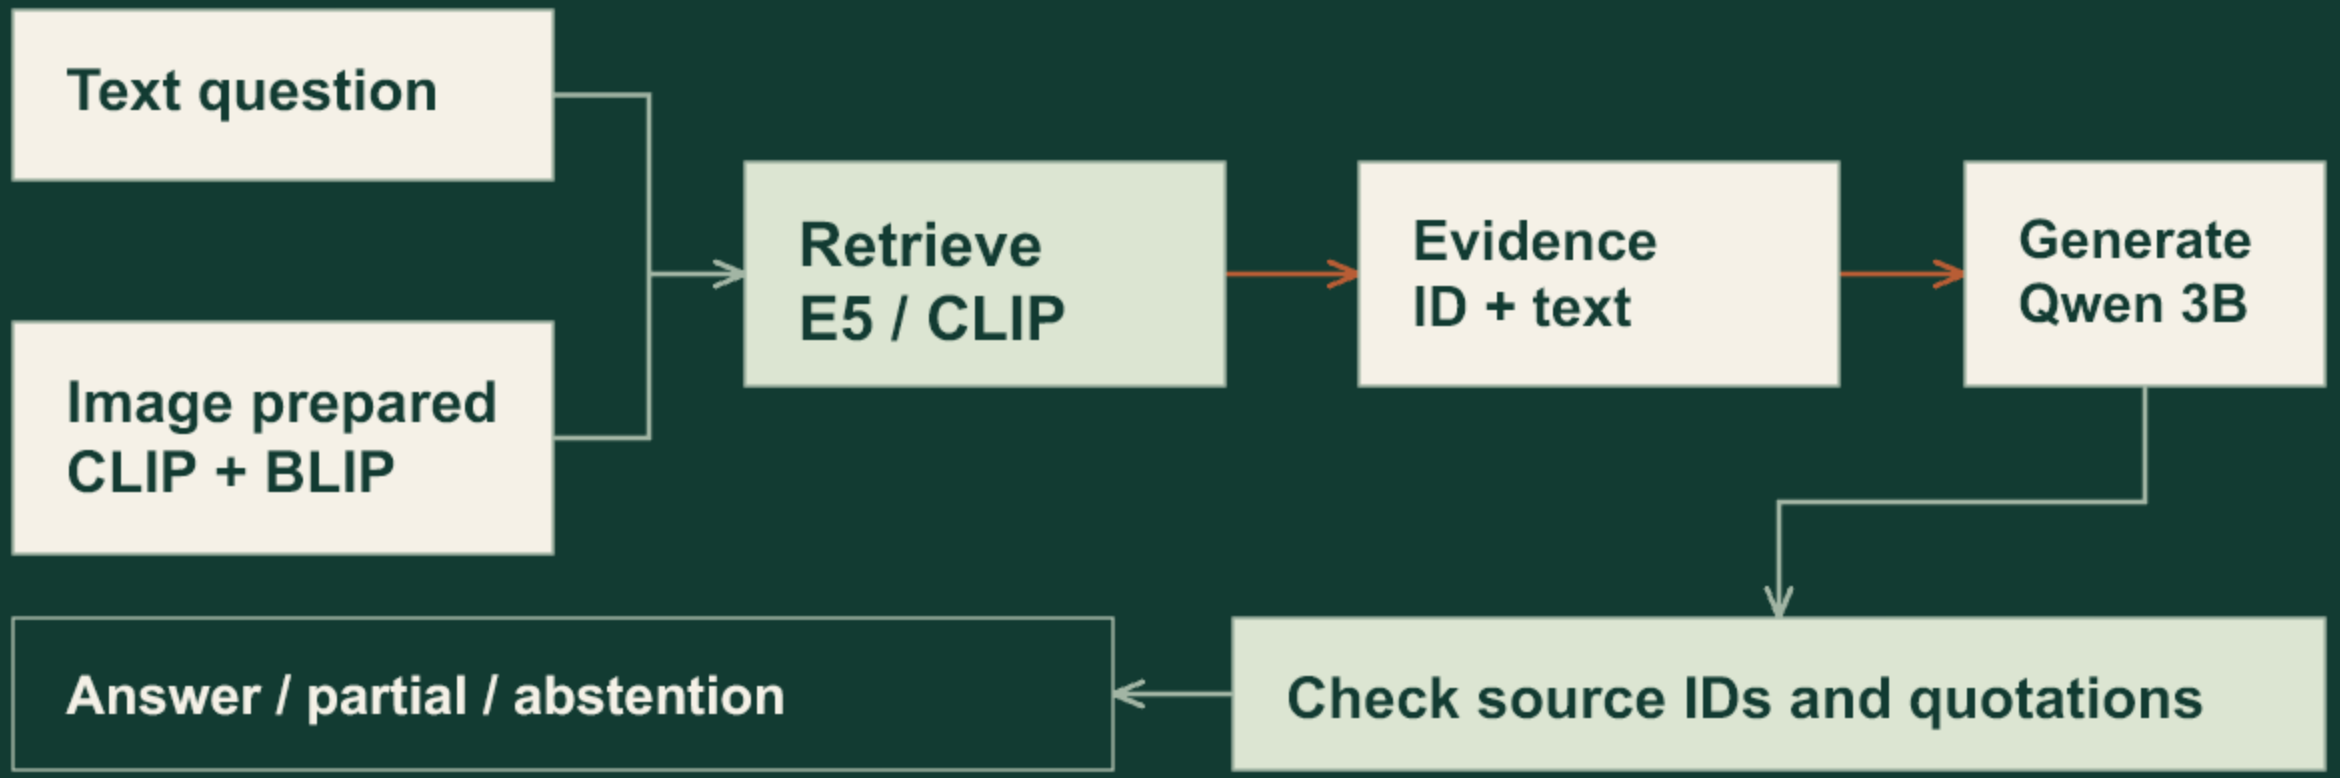

“About half the size of Eurasian Lynx”

Catalogue label: Lynx pardinus

8 results / 4 images + 4 texts / explicit diversity policy

Interface: top-k 1-50 / default 8 / distinct assets with explicit diversity

Task 3: answer from retrieved evidence

Technical errors stay separate

Shared preparation in memory. Quality warnings stay outside the prompt.

The frog case: evidence and uncertainty

Retrieved candidate

Pelophylax perezi

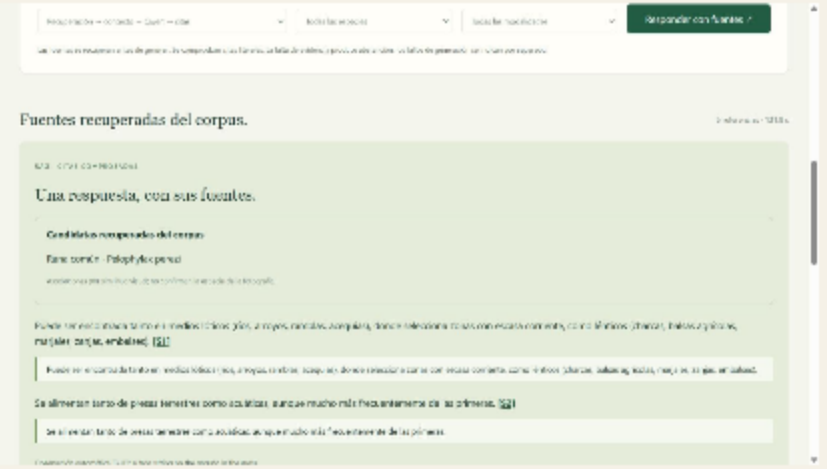

Habitat [S1]

“areas with little current”

Diet [S2]

“terrestrial and aquatic prey”

Actual interface / Spanish

Separate test: complete-genome request / abstained

Real model runs / translated extracts / species identity remains unconfirmed

The second run adds zero new vectors

16 steps / isolated storage / real CPU models

Reconciliation checks outcomes. This synthetic run is not a relevance benchmark.

How we tested the pipeline

Layer	Concrete check	Recorded result
Offline	Input limits, recovery and stored-state checks	469 tests passed
Integration	All zones twice, deterministic encoders	1 earlier test passed
CPU CLI	Real decoders and cached models	7 vectors, then 0 new
Browser	Selected top-k reaches HTTP handlers	8 earlier checks passed

Failure assertions inspect stored state and recovery

32 added cases: source conflicts, preserved outputs, incomplete vectors, 64/65 boundary

An input can fail before it reaches storage

lynx.jpg

Harmless MZ header / synthetic fixture

BLOCKED

Before hashing or upload

Corrupt files / empty inputs
Archive expansion / resource limits

Watermark warning retains the image

72.37% offline statement coverage / input screening does not replace antivirus

A query with a traceable answer

A result we can trace back to its source

Next: labelled retrieval and answer evaluation with specialist review
